

JC-WISE Workshop: Mapping Water Footprint Across Our Globe

The Workshop on Water Footprint is designed to help participants acquire knowledge of the innovative concept of Water Footprint with an inquiry-based approach. Through interactive activities, participants will learn about global freshwater distribution and Water Footprint from a spatial perspective, and look into the amount of virtual water hidden in the production of everyday food products. The JC-WISE Water Footprint Calculator mobile app, which is the first-of-its-kind in Hong Kong, will be utilised to calculate the amount of water resources used in producing the food we eat. By the end of the workshop, participants will gain a new insight into global water scarcity, and the hidden yet interconnected relationships between our consumption behaviour and the world's shrinking freshwater resources.
